Project Introduction

The aim of this project is to develop the online shopping website. The website is useful as the buyer can directly buy the products from home via internet on his mobile or any other system. The website reduces a lot of work-load for the customer as well as the owner. By this online shopping the product is directly delivered to the customer. Online shopping is the process consumers go through to purchase products or services over the Internet.

This is a small scale project for Online Men Accessories shopping system. The basic idea is that customers can buy products using internet. The system enables customers to browse through the various products available on our website and help them to purchase them online without visiting the shop physically. Online shopping system will use the internet as the sole method for selling goods to consumers. Shopping will be highly personalized using filters. It has a web shopping cart that enables to track products chosen and keep a record of the quantity ordered as well as keep a record of the previous orders made by the customer.

Project Scope

Created a webpage - “Alphamart - a male accessories shopping website”.

This website includes a homepage, showcasing the trending deals using a bootstrap carousel. It also displays categories of products to choose from and continue shopping. The website is client based and caters to all clients individually. The homepage also offers sign-up and login options. A new user is registered through the sign-up option and an existing user can continue to his session by logging in. Without logging in, the user can only view the products.

In case if user forgets his password then he can click on forgot password link and by providing email id registered with website can receive a mail with his current password

Once the user logs into his account, he is allowed to browse through all the products available at Alphamart. The user experience is made better by allowing him to view only those items which he wishes to see by using filters. The filters option filters out products and only display those which the user wishes to see.

The user can add the items he likes, to his cart. He can update the quantity of the selected items directly from the cart or remove it completely and confirm his order for the selected item.

The information of the user and his shopping details are stored in the database and is retrieved when required.

User after logging in successfully, can change his password using the settings option.

User can also view his past orders in settings menu.

Usability: Desktop , mobile , tablet , laptop or any other device with display and internet connection.

Reliability : The system is available during online time only .

Performance : The performance depends on hardware specification

Project Explanation (Technologies used)

- **Front end :**
 1. HTML
 2. CSS
 3. BOOTSTRAP
 4. ANGULAR JS

- **Back End :**
 1. PHP
 2. SMTP PROTOCOL
 3. JavaScript
 4. JQuery
 5. AJAX

- **Database:**
 1. MYSQL
